

ARTORS

A project website that ends in a booking.

Every unit listed and priced. Then a tour of the tower, the floor and the flat — with the token paid before the buyer leaves the room.

Prepared for Trident Realty

September 2026 · artors.in

THE PROBLEM

The tour ends, and so does the conviction.

1 The buyer leaves to think it over

A virtual tour that ends in an enquiry form wastes the moment it just created.

2 The follow-up call starts cold

Days later, on the phone, against three other projects they also saw.

3 The flat stays on the market

Nothing is held, so the unit they loved can be sold to someone else meanwhile.

The result

**A CRM full of warm leads
and an inventory sheet
that never moves.**

Familiar to every sales head.

Two jobs, two phases

1 The project website

Sell to the visitor who found you online.

- Every unit listed, filterable and priced
- Plans, areas, facing, availability, gallery
- OTP-verified enquiries that record the unit viewed
- Inventory and leads managed from one admin

Goes live on its own, before Phase 2 is ready.

2 The immersive booking layer

Close the buyer sitting in front of your executive.

- Turn the tower, pick a floor, open a home
- 360° walk-through of that home
- Block the unit and collect the token, live
- Salesman mode for the tablet and the lounge

Built on an engine that already works today.

PHASE 1

The project website

Unit listing

Every unit in the project, filtered by tower, BHK, floor, facing, area and budget.

Unit detail

Plan, carpet and super built-up area, facing, floor, indicative price, live status.

Floor plans

Typical floor plates per tower and a plan for every unit type.

Amenities & gallery

Amenity renders with descriptions, exteriors, interiors, site progress.

Location

Map, connectivity, landmarks and distances.

Legal & RERA

Registration numbers, disclaimers, privacy policy and terms.

Mobile first, and fast: the listing pages are server-rendered, so they also rank.

PHASE 1

The engine behind it

Inventory

- One source of truth for every unit
- Bulk upload from your existing Excel
- Available, blocked, booked, sold
- Every change logged with who and when
- Prices public, on request, or staff-only

Leads

- Phone OTP verification, so numbers are real
- Each lead records the unit being viewed
- Instant WhatsApp or SMS to the buyer
- Instant alert to the assigned executive
- Dashboard, assignment, notes, export

Admin

- Inventory and price-list editing
- Content, gallery and FAQ management
- Roles: admin, sales head, executive, finance
- No developer needed for daily changes
- Training session and manual at handover

The part that decides whether the site is still useful six months after launch.

PHASE 2

The buyer's journey

1 Turn the tower

Drag to rotate the building. The tower is outlined and live.

2 Pick a floor

Floors highlight one by one, with what is available on each.

3 See the homes

The floor plate opens, cut into flats and coloured by type.

4 Open the home

Full detail, the plan drawn to scale, renders, price break-up.

5 Walk it in 360°

Room to room through doorway arrows, or a walkable 3D model.

6 Book it

Block the unit and pay the token, in the same screen.

Steps 1 to 5 are working software today — we will show you. Step 6 is what Phase 2 adds.

PHASE 2

Salesman mode

1 Presentation view

Full screen on a tablet or the lounge display, controls big enough for a finger.

2 Live inventory

A flat booked in another office turns grey in front of the buyer.

3 Block a unit

One tap, a visible countdown. Holds expire and release themselves.

4 Cost sheet on screen

Base, floor rise, PLC, parking, charges and GST — computed, not typed.

5 Collect the token

On the buyer's own phone, with the receipt sent in seconds.

Why it matters

The executive with a live tower on a tablet outsells the one holding a printed price list — and never quotes a flat that was sold an hour ago.

Afterwards

Unit status, buyer details and the payment reference reach your CRM with no re-entry. Each executive gets their own dashboard.

HOW IT WORKS

From “I like this one” to a booked flat

The unit changes status only when the gateway confirms to our server — never on what a browser claims. A failed or abandoned payment releases the hold automatically.

Four things that protect Trident

1 Money never touches us

Payments settle directly into Trident Realty's own merchant account, on the gateway's normal cycle. We do not hold, route or disburse buyer funds.

2 The buyer pays on their own phone

Your executive never types a card number, CVV, UPI PIN or OTP. No card data reaches the tablet or our servers, which keeps the system out of PCI-DSS scope.

3 No flat is ever sold twice

A booking is written in one locked database transaction. Two executives booking the same flat in the same second produce one booking and one clear message.

4 No money, no booking

Status changes on the gateway's signed server confirmation only. Every hold, payment attempt, status change and refund is logged and exportable for audit.

What the buyer sees before paying

- RERA registration number of the project and agent, with the RERA website link
- That the token is a booking amount, not an allotment — allotment follows Trident's acceptance and the agreement to sell
- The cancellation and refund policy, shown and ticked before payment
- That prices, areas and images are indicative, and renders are artist impressions
- GST treatment of the token, and the receipt and invoice that follow
- Consent for data processing under the DPDP Act 2023, and the privacy policy

Who writes it

Trident's counsel supplies the wording. We build the flow around it and keep a versioned record of exactly which text each buyer accepted, and when.

Refunds

Performed by Finance from the admin panel, against your published policy, with a reason and an audit trail.

WHAT WE NEED

From Trident, for Phase 1

Inventory sheet	Excel, one row per unit: tower, floor, flat no., type, carpet, built-up, SBUA, balcony, facing, rate, status
Rate card	How a final price is computed — floor rise, PLC, parking, club, statutory charges, GST
Plans	Typical floor plate per tower and per floor type; unit plan per type with dimensions. PDF or CAD
Renders & photos	Exterior, interiors, amenities, site progress — at the highest resolution available
Project content	Specifications, approvals, possession dates, USPs, developer profile
Legal & brand	RERA numbers, disclaimers, privacy policy, terms; logo, fonts, colours, guidelines
Access & owner	Domain or subdomain access, enquiry recipients, and one empowered person to sign off

The clock starts when these arrive, not at signing.

WHAT WE NEED

From Trident, for Phase 2

Tower orbit renders	180–240 frames, full 360°, 4K, day (night optional) — delivered as numbered frames, not video
ID / Cryptomatte masks	On 13–20 stop frames. This is what makes each floor, flat and balcony clickable to the pixel
360° interiors	Equirectangular 2:1, 8000 × 4000, one per room, camera at 1.5 m, one set per unit type
Unit 3D model	GLB or FBX in metres, under ~300k triangles, PBR materials, rooms named
Payment gateway	Trident’s own merchant account with KYC complete, test and live keys
Token policy & terms	Token amount or formula, hold duration, and legally approved booking terms
Sales roles	Who may block, who may book, who may refund, and approval limits

A full technical brief for your rendering studio comes with this proposal — frame counts, mask passes, camera settings, file naming, and a small pilot batch we test before the full render, so nothing is wasted.

ARCHITECTURE

How it is built

FRONTEND

React + Next.js, server-rendered

Search visibility for the listing pages, speed on mobile

IMMERSIVE LAYER

Our React + Three.js engine

Already built and proven; embeds inside any page

BACKEND

Node.js API + PostgreSQL

Transactional integrity — what makes double-booking impossible

MEDIA

Object storage behind a CDN

Orbit frames and panoramas are large; they stream from the edge

PAYMENTS

Razorpay / PayU / Cashfree

Funds settle to Trident; no card data touches our systems

HOSTING

Managed cloud, Indian region

Data residency, latency, DPDP alignment

Encrypted in transit and at rest · daily backups with a tested restore · uptime monitoring · rate limiting on forms and payment endpoints · a full audit log

TIMELINE

Phase 1 in 7–8 weeks, Phase 2 in 10–12

Phase 2 runs partly in parallel. The gate is the renders — which is why your studio is briefed in week 1, not after Phase 1 ships.

Commercials

Phase 1

Website, inventory, leads

Build **Rs** _____

Support / year **Rs** _____

Phase 2

Immersive tour and booking

Experience **Rs** _____

Booking engine **Rs** _____

Per tower / unit type **Rs** _____

Third-party costs

Billed at cost

Hosting, CDN, SMS and WhatsApp credits, and the payment gateway’s own transaction fee are charged by those platforms to Trident directly. We add no margin on them, and we agree a monthly ceiling in advance.

40% on signing · 30% on design sign-off · 20% on UAT · 10% on go-live, per phase. 60 days of warranty after each go-live, then an annual support retainer. This proposal is valid for 30 days.

THE RETURN

What Trident gets

Decide today

The buyer commits standing in the home they just walked through, not two weeks later on a cold call.

Paid on the spot

Token collected at the moment of conviction, on the buyer's own phone, receipt in seconds.

Never sold twice

One live inventory across every office. No evening spent reconciling three spreadsheets.

Every tour measured

Which towers, which floors, which units are blocked but not paid — marketing follows evidence.

And the platform outlives the project — the second Trident project is a configuration, not another build.

NEXT STEP

A walkthrough of the working demo.

Tower, floors, units, floor plans and a 360° tour — judged as a working thing rather than a description of one. Confirm the phasing and the token policy, and your studio can be briefed the same week.
